Use webhooks

This guide will help you working with webhooks.

Create webhook

To create a webhook for your bot navigate to "Bots" and click on "Webhooks". A modal will appear.

To add a webhook enter the exact channel name for the webhook. Messages sent to the webhook will be sent to this channel.

Trigger webhook

To trigger an webhook send a post request to the url field specified by url column. To authorize you need to pass an X-Token Header. The body expects an json object with exactly one field:

```
1 {
2   "message": "Wuhu, I am a message from the webhook! :3"
3 }
```

Then everything was successfully you get:

```
1 {
2   "message": "Webhook executed successfully"
3 }
```
